Biodiversity For The National Parks

BY ANTHONY VARGAS

Data on Different Species

In This Data we are given The Scientific name of each species, The common names of each species and The species conservation status.

- Conservation Status   Scientific Name
- 0 Endangered   15
- 1 In Recovery   4
- 2 Species of Concern   151
- 3 Threatened   10

In creating a Column Graph using Category Pivots, in its findings it shows that The Category Mammals are more likely to be endangered than birds.

My recommendations to the conservationists that are concerned about animals that are endangered is to be moved to In Recovery Category so they are not endangered of Extinction.

Foot and Mouth Disease Study

The Determination sample size is at a 33% accuracy in finding these sheep's having foot and mouth disease. They would have to spend 2 weeks at Bryce National Park and 1 week at Yellowstone National Park.
